BOX DOCCIA

ATELIER *delle* FINITURE

Da una sola materia prima, l'alluminio, al prodotto finito ottenuto con un unico procedimento di colorazione. Nasce ATELIER DELLE FINITURE, che offre numerosi vantaggi estetici e pratici:

- armonia visiva
- maggiore percezione dello spazio
- maggiore valore estetico e percepito
- facilità di manutenzione.

From a single raw material–aluminum–to the finished product, achieved through a single coloring process. This is the origin of ATELIER DELLE FINITURE, which offers numerous aesthetic and practical advantages:

- *visual harmony*
- *greater perception of space*
- *increased aesthetic and perceived value*
- *ease of maintenance*

Von einem einzigen Rohmaterial – Aluminium – bis zum Endprodukt, das durch ein einziges Farbverfahren entsteht.

So entsteht das ATELIER DELLE FINITURE, das zahlreiche ästhetische und praktische Vorteile bietet:

- *visuelle Harmonie*
- *besseres Raumempfinden*
- *höherer ästhetischer und wahrgenommener Wert*
- *einfache Wartung*

DALL'ALLUMINIO ALL'ATELIER DELLE FINITURE

FROM ALUMINUM TO THE ATELIER DELLE FINITURE
VOM ALUMINIUM ZUM ATELIER DELLE FINITURE

ATELIER *delle*
FINITURE

- La collezione è ottenuta mediante la fresatura con CNC (controllo numerico computerizzato), processo sottrattivo, in cui il materiale viene rimosso da un blocco grezzo con utensili da taglio rotanti per ottenere la forma desiderata.

Fresare l'alluminio può costare fino a dieci volte di più rispetto alla pressofusione della zama perché:

- l'alluminio, è generalmente più costoso della zama;
- la lavorazione richiede più tempo e macchinari specifici;
- si generano più scarti;
- è ideale per serie in quantità limitata;
- ogni dettaglio deve essere pensato in anticipo; se si commettono errori sulle misure i componenti non coincidono e gli elementi attivi, come le cerniere, non funzionano.

- The collection is made using CNC (computer numerical control) milling, a subtractive process where material is removed from a raw block using rotating cutting tools to achieve the desired shape.

Milling aluminum can cost up to ten times more than die-casting zamak because:

- aluminum is generally more expensive than zamak;
- the process requires more time and specialized machinery;
- it generates more waste;
- it is ideal for small production runs;
- every detail must be planned in advance; if measurements are wrong, the parts won't match and active components, such as hinges, will not work.

- Die Kollektion wird durch CNC-Fräsen (computerisierte numerische Steuerung) hergestellt – ein subtraktives Verfahren, bei dem Material aus einem Rohblock mit rotierenden Schneidwerkzeugen entfernt wird, um die gewünschte Form zu erhalten.

Das Fräsen von Aluminium kann bis zu zehnmal teurer sein als das Druckgießen von Zamak, weil:

- Aluminium im Allgemeinen teurer ist als Zamak;
- der Bearbeitungsprozess mehr Zeit und spezielle Maschinen erfordert;
- mehr Abfall entsteht;
- es ideal für Kleinserien ist;
- jedes Detail im Voraus durchdacht werden muss; bei Maßfehlern passen die Komponenten nicht zusammen und aktive Elemente wie Scharniere funktionieren nicht.
